Fall Protection System

BNK subcontractor, Bauer Technologies Ltd, has developed a concreting platform to provide a safe working area for operatives during concreting of diaphragm wall panels.

The prefabricated frame removes the risk of falls into the open panel and eliminates risk of trips and falls by raising the working platform above the protruding trapping beams and sonic tubes of the reinforcement cage. The frame is fitted with a solid edge protection, locks securely between the guide walls and is lifted in position with the crane to avoid manual handling.
