Nevosafe rebar safety strips

C405 Paddington Station are using Nevosafe rebar safety strips as an alternative supplementary protection system along with mushroom end caps to protect workers from the sharp protruding ends of steel rebar which is often used in the construction industry typically as reinforcement for reinforced concrete slabs, beams, columns etc.

The system comprises of a highly visible plastic strip available in different colours and in lengths of 1m that is reinforced with a steel core. It is clipped on to the protruding ends of reinforcement bars in order to prevent a falling construction worker from being impaled on the protruding rebar. Test certification is in place confirming that the rebar safety strip can safely withstand the impact of a 100 kg sandbag dropped centrally from a height of 3m thereby simulating a slip, trip or fall from a passing construction worker.
